Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin agonist; antilipemic; cardiant; triglyceride; inotropic;
diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Check: 249
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type: P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin agonist; antilipemic; cardiant; triglyceride; inotropic;
diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is an agonist of exendin, exendin-4 amide (residues 1-
                                                                                                                                                                                                                                                                                                                                                                        Exendin-4; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
          The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The
exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin agonist; antilipemic; cardiant; triglyceride; inotropic;
diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                         Type: P
                                                                                                                                                                                                                                                                                                                                                                                to: 39

levels, and treating heart disease and dyslipidemia.

Example 26; Page; 161pp; English.

```
The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                      AAE08379

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                  The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin agonist; antilipemic; cardiant; triglyceride; inotropic;

                                                                                                                                                                                               Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                             The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAE08376;
   XBXBXBXBXBXBXBXBXBXBXBX
                                                                                                                                                                             Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                             The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incrropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAE08375 Length: 39 February 4, 2005 13:32 Type: P Check: 706 Found using 'seq5' (mohamed337.key)

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                        Exendin agonist, antilipemic, cardiant, triglyceride, inotropic;
diuretic, coronary heart disease, dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

AAE08373;
  Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ٠:
                                                                                                                                                                                                                                                                                                               Exendin agonist, antilipemic, cardiant, triglyceride; inotropic, diuretic, coronary heart disease, dyslipidaemia.

The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and duretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                          The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Type: P Check: 9966
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to: 39

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAE08369;
    Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                         The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 match
    Use of exendin and exendin agonist compounds for modulating triglyceride
levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                     Exendin agonist; antilipemic; cardiant; triglyceride; inotropic;
diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAE08365 Length: 39 February 4, 2005 13:32 Type: P Check: 9251

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial iriglyceride levels. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                              The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin sponist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-JUL-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAE08362;
  Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                            The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                triglyceride; inotropic;

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inciropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                             /note= "C-terminal amide"
                                                                   /note= "Naphthylalanine"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              UXXXIXEXXXXXXELLXXX
Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptides sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                        Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; dinretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

exendin and exendin agonist compounds for modulating triglyceride, and treating heart disease and dyslipidemia.
suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                       :
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incircipic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                      Exendin agonist, antilipemic; cardiant, triglyceride, inotropic; dinretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Type: P Check: 9804
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             to: 39

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                           Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                  The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin agonist, antilipemic, cardiant, triglyceride, inotropic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAE08355;
The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is Heloderma suspectum modified exendin-4 peptide which
                                                                                                                                                                                                                                                                                                                        Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin agonist; antilipemic; cardiant; triglyceride; inotropic;

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.

Young AA;

Kolterman OG,

WPI; 2001-514422/56.

Claim 13; Page 56; 161pp; English.

The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is an agonist of exendin, exendin-4 amide (residues 1-30) from Heloderma suspectum

                                                                                                                                                                                                                                                     Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                exendin and exendin agonist compounds for modulating triglyceride, and treating heart disease and dyslipidemia.
                                                                                                                                  The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is exendin-3 peptide from Heloderma horridum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin-4; antilipemic; cardiant; triglyceride; inotropic; diuretic;
coronary heart disease; dyslipidaemia.

The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is an agonist of exendin, exendin-4 (residues 1-30) from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin-4; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incircopic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. They besent sequence is exendin-4 peptide from Heloderma suspectum
                                                                                                                                                                                                                                                                                                                                                                                         Check: 9570
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type: P Check: 4889

The invention is directed towards the amelioration of organ tissue injury caused by reperfusion of blood flow after ischemia. The method involves administering a composition containing a compound which binds to a receptor for glucagon-like peptidel (GLP-1) in a carrier. GLP-1 effectively enhances peripheral glucose uptake without inducing dangerous hypoglycemia. GLP-1 strongly suppresses glucagon secretion, independent of its insuliniotropic action and powerfully reduces plasma free fatty, acid (FRA) level having major toxic mechanism during myocardial ischemia, substantially more than can be accomplished with insulin. The method is unithout side effects normally attendant with therapies presently available. GLP-1 suppresses paracrine by intra-islet release of insulin or somatostatin. GLP-1 is unique in its capacity to simultaneously stimulate insulin secretion and inhibit glucagon release. The present sequence represents a gila monster venom exendin 4 peptide fragment, homologous to a mammalian GLP-1 peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin-3; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAE08345;
The invention is directed towards the amelioration of organ tissue injury caused by reperfusion of blood flow after ischemia. The method involves administering a composition containing a compound which binds to a receptor for glucagon-like peptide-1 (GLP-1) in a carrier. GLP-1 effectively enhances peripheral glucose uptake without inducing dangerous hypoglycemia. GLP-1 strongly suppresses glucagon secretion, independent of its insuliniotropic action and powerfully reduces plasma free fatty substantially more than can be accomplished with insulin. The method is without side effects normally attendant with therapies presently available GLP-1 suppresses paracrine by intra-islet release of insulin stimulate insulin secretion and inhibit glucagon release. The present sequence represents a gill monster venom exendin 3 peptide fragment,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GLP-1; organ tissue; injury; reperfusion; ischemia; glucose; exendin; glucagon-like peptide-1; vasotropic; antiarrhythmic; antidiabetic; gila monster; venom.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Metabolic intervention with GLP-1 improves function of ischemic and reperfused tissue.

Target of execution configurations of positions 34-39 or a Lype at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a lipophilic substituent. X is covalently bound to Z, a peptide sequence of 1-4-20 amino acids. Each amino acid in Z is selected from A, L, S, T, Y, N, C (1-6) - R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl and amino acid units of formula -NH-C(R1) (R2)-(C1-6) - R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl and phenyl methyl, where C1-6-alkyl is optionally substituted with 1-3 substituents selected from halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl c1-6-alkyl, C2-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy; or R1 and R2, together with the carbon atom to which they are bound, form a cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2, 4-diaminobutanoic acid and 2,3-diaminobropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that X is not exendin-4 or exendin-3. The peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, insulin censisted with elevated blood glucose levels elicited by hormones known censisted with elevated blood glucose levels elicited by hormone show adrenalin, glucocorticoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating insulin release, for centing plasma lipid level, and for reducing mortality and morbidity
                         Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity
                                                                                                                                                                                                          The present sequence is peptide X, a component of a novel peptide conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys
                                                                                                                                                Claim 23; Page 67; 83pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   after myocardial infarction
                                                                                      and eating disorders.

Larsen BD, Mikkelsen JD,

Neve 5;

WPI; 2001-159381/16.

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 22; Page 66; 83pp; English.

The present sequence is a peptide conjugate comprising a peptide (X)
which is an exendin at least 90 % homologous to exendin-4, a variant of
exendin comprising 1-5 deletions at positions 34-39 or a Lys at position
confidence of the sequence of the sequence of the septide (GLP-1) (736) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino
isoburyric acid for Ala at position 8 and/or having a lipophilic
substituent, and Z, a peptide sequence of 4-20 amino acids covalently
bound to the variant. Each amino acid in Z is selected from A, L, S, T,
Y, N, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NHc(R1) [R2)-(G-G)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and
phenyl-methyl, where C1-6-alkyl is optionally substituted with 1-3
substituents selected from halogen, hydroxy, amino, cyano, nitro,
sulfono, and carboxy, and phenyl and phenylmethyl are optionally
alogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy; or R1 and
R2, together with the carbon atom to which they are bound, form a
cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic

acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that X is not exendin-4 or parendin-3. The peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, hyperglycaemia, metabolic disorders and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels elicited by hormones known to increase blood glucose levels elicited by normones and catechol amines including adrenalin, glucocorticoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating insulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction 888888888888888

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 22; Page 66; 83pp; English.

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lya at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a lipophilic substituent, and Z, a peptide sequence of 4-20 amino acids covalently bound to the variant. Each amino acid in Z is selected from A, L, S, Y, N, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-

Fri Feb

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-2 deletions at positions 34-39 or a Lys at position 36. Or a Lys at position 26. Sebelian at least 90 % homologous to a Lys at position 36. Or GLP-1 (7-37) having a substituent, a glucagon-like peptide (GLP-1) (7-50 % or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino consistent and Z. a peptide sequence of 4-20 amino acide covalently consistent, and Z. a peptide sequence of 4-20 amino acide covalently bound to the variant. Each amino acid in Z is selected from A, L, S, T, Y, N, O, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-CC (R1) (R2)-C(-6)-. R1 and R2 are selected from H, Cl-6-alkyl, phenyl and phenyl-methyl, where Cl-6-alkyl is optionally substituted with l-3 substituents selected from halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl are optionally cyclopentyl, or cycloheptyl ring, e.g. 2.4-diaminobutanoic consultance with h-3 substituent atom to which they are bound, form a cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2.4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide cyclopentyl, cycloheptyl ring, e.g. 2.4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the provise that X is not exendin-4 or exendin-3. The peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disease states associated with elevated blood glucose levels electiced by hormones known to increase blood glucose levels, such as creachly and morbidity after myocardial infarction and for reducing plasma lipid level, and for reducing constituents plasma lipid level, and for reducing plasma lipid level, and for reducing plasma lipid levels and carboxy. Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucese and for treating diseases like diabetes, obesity and eating disorders. Glucagon-like peptide-1; GLP-1; exendin-4; antidiabetic; anorectic; antiinflammatory; peptide conjugate; diabetes; obesity; insulin resistance syndrome; eating disorder; hyperglycaemia; metabolic disorder; gastric disease; mycoardial infarction. aab69980 ; (Lys)6-des Pro36, Pro37, Pro38-exendin-4(1-39)-NH2 [Lys) 6-des Pro36, Pro37, Pro38-exendin-4(1-39)-NH2. to: from: 1 Neve S; AAB69980 standard; peptide; 42 AA Claim 22; Page 66; 83pp; English. 99US-0143591P. 99EP-00610043. 12-JUL-2000; 2000WO-DK000393. check: 8306 Mikkelsen JD, (first entry) (ZEAL-) ZEALAND PHARM AS WPI; 2001-159381/16. ```
The present sequence is a peptide conjugate comprising a peptide (X)
which is an exendin at least 90 % homologous to exendin-4, a variant of
exendin comprising 1-5 deletions at positions 34-39 or a Lys at position
40 having a lipophilic substituent, a jouragon-like peptide (GLP-1) (7-
36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino
to substituent, and Z, a peptide sequence of 4-20 amino acids covalently
bound to the variant. Each amino acid in Z is selected from A, L, S, T,
Y, N, O, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-
CC (R1) (R2)-(C-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and
phenyl-methyl, where C1-6-alkyl is optionally substituted with 1-3
substituents selected from halogen, hydroxy, amino, cyano, nitro,
substituted with 1-3 substituents selected from (2-6-alkyl), C2-6-alkenyl,
cubstituted with 1-3 substituents selected from C1-6-alkyl, C2-6-alkenyl,
cubstituted with the carbon, and carboxy, or R1 and
CC cald and 2,3-diaminopropancic acid or its salt, or the C-terminal amide
cC cof the peptide conjugate with the proviso that X is not exendin-4 or
exendin-3. The peptide conjugate is useful in the manufacture of a
pharmaceutical composition for use in treatment of type 1 or type 2
diabetes, insulin resistance syndrome, obesity, etting disorder,
cycloseria, metabolic disorders and gastric disease. It is useful for
treating disease states associated with elevated blood glucose levels
clicited by hormones known to increase blood glucose levels, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity

The present sequence is peptide X, a component of a novel peptide conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position of D-Ala, Gly or lipophilic substitutent. X is covalently bound to Z, a peptide sequence of 11pophilic substituent. X is covalently bound to Z, a peptide sequence of C(4-D) - R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-cc C(-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-cc C(-6)-alkyl is optionally substituted with 1-3 substituents selected from halogen, hydroxy, amd phenyl and phenylmethyl are optionally substituted with 1-3 substituents selected from C1-6-alkyl, phenylmethyl, halogen, hydroxy, and phenyl and phenylmethyl are optionally substituted with 1-3 substituents selected from C1-6-alkyl, C2-6-alkenyl, halogen, hydroxy, amd phenyl and phenylmethyl are optionally substituted with 1-3 substituents selected from C1-6-alkyl, c2-6-alkenyl, halogen, hydroxy, amd phenyl and phenylmethyl are optionally substituents selected from C1-6-alkyl, c2-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy; or R1 and R2, together with C2 substituents selected from C1-6-alkyl, c2-6-alkenyl, halogen, ylonenyl, cc conjugate with they are bound, form a cyclopentyl, cyclohetyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-diabetes, insulin created conjugate is useful in the manufacture of a pharmaceutical composition for useful in the manufacture of a pharmaceutical composition for useful in the manufacture of a pharmaceutical composition for useful in the manufacture of a pharmaceutical composition for useful in the manufacture of a pharmaceutical composition dasarric disease. It is useful for treathyl dasase states as states and caracted with elevated blood glucose levels, such as catechol amines including cegariation of gastric emptying, for stimulating of cr
                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 22; Page 66; 83pp; English.

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34.39 or a Lys at position (4) having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-37) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a lipophilic substituent, and Z, a peptide sequence of 4-20 amino acids covalently bound to the variant. Each amino acid in Z is selected from A, L, S, T, Y, M, Q, D, G, K, R, M, M, Orn, and amino acid units of formula -NH-C(R1) (R2)-C(=0)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-methyl, where C1-6-alkyl is optionally substituents selected from halogen, hydroxy, and naino, cyano, nitro, sulfono, and carboxy, and phenyl and phenyl-methyl are optionally substituted with 1-3 substituents selected from C1-6-alkyl, C2-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, or R1 and R2 are selected from C1-6-alkyl, C2-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, or R1 and C2 cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that X is not exendin-3. The peptide conjugate is useful in the manufacture of a shown in an antiacture of a shown in a carbox or and and an antiacture of a characture of a shown in a carbox or and and an antiacture of a characture of diabetes, insulin resistance syndrome, obssity, eating disorder, hyperglycaemia, metabolic disorders and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including adrenalin, glucocorticoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating insulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction

```
CC Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-C(R1)(R2)-CC C(=0)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-CC methyl, where C1-6-alkyl is optionally substituted with 1-3 substituents selected from C1-6-alkyl, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl are optionally substituted with 1-3 carboxy, and phenyl and phenylmethyl are optionally substituted with 1-3 corporation nitro, sulfono, and carboxy, or R1 and R2, together with the carbon atom to which they are bound, form a cyclopentyl, cyclohexyl, cr cycloheptyl ring, e-g. 2, 4-diaminobutanoic acid and 2,3-cdiaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that X is not exendin-4 or exendin-3. The composition for use in treatment of type 1 or type 2 diabetes, insulin creatstance syndrome, obesity, eating disorder, hyperalycaemia, metabolic disorders and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including adrenalin, glucocorticoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating mortality and morbidity clowering plasma lipid level, and for reducing mortality and morbidity at after myocardial infarction

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 23; Page 67; 83pp; English

the present sequence the pepting of a component of a movel pepting conjugate. X is an exendin at least 90 % homologous to exendin 4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (CID-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a lipophilic substituent of D-Ala, IJ, S, T, Y, N, CC (1), G, K, R, H, M, Orn, and amino acid units of formula -NH-C(RI) (R2)-CC 1: pophilic substituent. X is covalently bound to Z, a peptide sequence of C 4-20 amino acids. Each amino acid units of formula -NH-C(RI) (R2)-CC (-6)-R). RI and R2 are selected from H, CI-6-alkyl, phenyl and phenyl-cc c (-6)-R). RI and R2 are selected from Alabora, nation, cyano, nitro, sulfono, and carboxy, or R1 and R2, together with 1-3 substituents selected from CI-6-alkyl, are optionally substituents with 1-3 carboxy, amino, cyano, nitro, sulfono, and carboxy, or R1 and R2, together with the carbon atom to which they are bound, form a cyclopentyl, cyclohexyl, c amino, cyano, nitro, sulfono, and carboxy, or R1 and R2, together with the carbon atom to which they are bound, form a cyclopentyl, cyclohexyl, cc diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type I or type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, hyperglycaemia, metabolic composition for use in treatment of type I or type 2 diabetes, insulin composition for use in treatment of type I or type 2 diabetes including associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including associated with elevated blood glucose levels elicited by hormones kernel lowering plasma lipid level, and for reducing mortality and morbidity composition in infarction The present sequence is peptide X, a component of a novel peptide Sequence 39 AA;

or cycloheptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that X is not exendin-4 or exendin-3. The peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, hyperglycaemia, metabolic disorder and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including adrenalin, glucocorticoids, growth hormone and glucagon. It is useful in requlation of gastric embtying, for stimulating insulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is peptide X, a component of a novel peptide conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a paptide sequence of 11pophilic substituent. X is covalently bound to Z, a peptide sequence of 4-20 amino acids. Each amino acid in Z is selected from A, L, S, T, Y, N,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Glucagon-like peptide-1; GLP-1; exendin-4; antidiabetic; anorectic; antiinflammatory; peptide conjugate; diabetes; obssity; insulin resistance syndrome; eating disorder; hyperglycaemia; metabolic disorder; gastric disease; myocardial infarction.

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity

Claim 23; Page 67; 83pp; English.

and eating disorders.

The present sequence is peptide X, a component of a novel peptide conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or lipophilic substituent. X is covalently bound to Z, a peptide sequence of 1-20 amino acids. Each amino acid in Z is selected from A, L, S, T, Y, N, CC Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-C(R1) (R2)-CC (1-0)-. R1 and R2 are selected from H, Cl-6-alkyl, phenyl and phenyl are cyclonally substituted with 1-3 substituents selected from Cl-6-alkyl, C2-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, on R1 and R2, together with the carbon atom to which they are bound, form a cyclopentyl, cyclohexyl, cr cycloheptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-cr cycloheptyl ring, e.g.

ptide agonist of Glucagon-like peptide, useful for decreasing the blood glucose and for treating diseases like diabetes, obesity peptide agonist of blood alument and eating disorders. Novel level

Claim 23; Page 67; 83pp; English.

The present sequence is peptide X, a component of a novel peptide conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or CLP-1 (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or CLP-1 (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or CC (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or CC (-0) or X, K, K, M, M, Orn, and amino acid in Z is selected from A, L, S, T, Y, N, CC (-0) or X, A, X, K, M, M, Orn, and amino acid units of formula -NH-C(R1) (R2) or CC (-0) or X, A Hand R2 are selected from H, C1-6-alkyl, phenyl and phenyl methyl are optionally substituted with 1-3 substituents selected from halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, or R1 and R2, together with the arbon atom to which they are bound, form a cyclopentyl, cyclohexyl, cr cycloheptyl ring, e.g. 2, 4-diaminobutanoic acid and 2,3-corylopetyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-corylopetyl acid or its salt, or the C-terminal amide of the peptide conjugate is useful in the manufacture of a pharmaceutical conjugate is useful in the manufacture of a pharmaceutical secondary, eating disorder, hyperalycamine manufacture of a pharmaceutical associated with elevated blood glucose levels elicited by h after myocardial infarction

peptide agonist of Glucagon-like peptide, useful for decreasing the of blood glucose and for treating diseases like diabetes, obesity Claim 22; Page 66; 83pp; English. level of blood glucos and eating disorders. WPI; 2001-159381/16. Novel

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34.39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-6) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino consolvaric acid for Ala at position 8 and/or having a lipophilic substituent, and Z, apptide sequence of 4-20 amino acids covalently consolvaric acid for Ala at position 8 and/or having a lipophilic substituent, and Z, apptide sequence of 4-20 amino acids covalently bound to the variant. Each amino acid in Z is selected from A, L, S, T, C, W, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-cCC (RI) (R2)-C(=0)-. RI and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-methyl, where C1-6-alkyl is optionally substituents selected from halogen, hydroxy, and phenyl and phenylmethyl are optionally consolvant action, and carboxy, and phenyl and phenylmethyl are optionally substituted with 1-3 substituents selected from C1-6-alkyl, C2-6-alkenyl, abstituents selected from c1-6-alkyl, C2-6-alkenyl, and phenylmethyl are optionally correctly amino, cyano, nitro, sulfono, and carboxy, and phenylmethyl and carboxy; or R1 and C2-6-alkyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic ccc acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the creminal amide of the peptide conjugate with the provise that X is not exendin-3. The peptide conjugate is useful in the manufacture of a catechol amines including adrenalin, glucocorticoides, growth hormone and catechol amines including adrenalin, glucocorticoides, growth hormone and clicited by hormones known to increase blood glucose levels, insulin release, for lowering plasma lipid level, and for reducing consultity and morbidity after myocardial infarction

Neve S;

Mikkelsen JD,

Larsen BD,

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 22; Page 66; 83pp; English

The present sequence is a peptide conjugate comprising a peptide (X)
which is an exendin at least 90 % homologous to exendin-4, a variant of
exendin comprising 1-5 deletions at positions 34-39 or a Lys at position
40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (736) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino
cisobutyric acid for Ala at position 8 and/or having a lipophilic
bound to the variant. Each amino acid in Z is selected from A, L, S, T,
CC (RL) (RD)-C(-G)-R1 and R2 are selected from H, CI-6-alkyl, phenyl
cc phenyl-methyl, where CI-6-alkyl is optionally substituted with 1-3
substituents selected from halogen, hydroxy, amino, cyano, nitro,
substituted with 1-3 substituents selected from CI-6-alkyl, pc substituted with 1-3 substituents selected from CI-6-alkyl, c2-6-alkenyl,
cc substituted with the carbon atom to which they are bound, form a
cyclopentyl, cyclohexyl, amino, cyano, nitro, sulfono, and carboxyl, or R1 and
cc cyclopentyl, cyclohexyl mino, cyano, nitro, sulfono, and carboxyl, or CC acid and C2-3-diaminopropanoic acid or its salt, or the C-terminal amide
cc of the peptide conjugate with the proviso that X is not exendin-3
cc confin-3. The peptide conjugate is useful in the manufacture of a
confin-3. The peptide conjugate is useful in the manufacture of a
confined conjugate mit treatment of type 1 or type 2
confined conjugate mit treatment of type 2
confined conjugate mit treatment of confired conjugate mit treatment of type 1 or type 2
confired conjugate mit the carbon confired conjugate mit treatment of type 1 or type 2
confired conjugate mit treatment of type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, hyperglycaemia, metabolic disorders and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including adrenalin, glucocorticoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating insulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 22; Page 66; 83pp; English.

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletations at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino classification and Z, a peptide sequence of 4-20 maino acids covalently bound to the variant. Each amino acid in Z is selected from A, L, S, T, Y, N, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-CC (RI) (R2)-C(-G)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-methyl, where C1-6-alkyl is optionally substituted with 1-3 substituents selected from halogen, hydroxy, amino, cyano, nitro, substituted with 1-3 substituence of arboxy, or an phenyl and phenylmethyl are optionally substituted with 1-3 substituence selected from C1-6-alkyl, C2-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy; or R1 and

cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that x is not exendin-4 or exendin-3. The peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, hyperallycaemia, metabolic disorder and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including adremalin, glucocorticoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating insulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction form a together with the carbon atom to which they are bound,

Sequence 44 AA;

```
The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position conformation of a Lys at position of the peptide (GLP-1) (7-6) and the peptide (GLP-1) (7-7) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a lipophilic cubstituent, and Z, a peptide sequence of 4-20 amino acids covalently bound to the variant Each amino acid in 2 is selected from A, L, S, T, Y, M, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-CC (XI) (RZ) C(=0)-. RI and R2 are selected from H, CI-Calkyl, phenyl and phenyl-methyl, where CI-C-alkyl is optionally substituted with 1-3 substituents selected from H, CI-C-alkyl, phenyl and phenyl-methyl, where Malogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl are optionally consistituted with 1-3 substituents selected from CI-C-alkyl, C2-G-alkenyl, alogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, or RI and C2, together with the carbon atom to which they are bound, form a cycloheptyl, cycloheptyl,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Glucagon-like peptide-1; GLP-1; exendin-4; antidiabetic; anorectic; antiinflammatory; peptide conjugate; diabetes; obesity; insulin resistance syndrome; eating disorder; hyperglycaemia, metabolic disorder; gastric disease; myocardial infarction.

```
exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with compilications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporabilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                     Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exendins or exendin agonists for lowering or reducing blood plevels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention relates to the use of an exendin (AAB64181-B64182) or an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 183; Page 121; 133pp; English.
                                           Exendin agonist, SEQ ID NO:188.

and eating disorders.

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) burytric acid for Ala at position 8 and/or having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-37) having a substitution of D-Ala, Gly or alpha-amino cid sobutyric acid for Ala at position 8 and/or having a lipophilic substituent, and Z, a peptide sequence of 4-20 amino acids covalently cy N, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-C(R1)(R2)-C(=0)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-methyl, where C1-6-alkyl is optionally substituted with 1-3 substituents selected from H, C1-6-alkyl, phenyl and carboxy, and phenyl methyl are optionally cyclohexy, and phenylmethyl are optionally considered from halogen, hydroxy, and phenylmethyl are optionally considered with 1-3 substituents selected from C1-6-alkyl, or Substituents selected from C1-6-alkyl, or Substituents selected from A1-6-alkyl, or Cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic confidence with the proviso that X is not exendin-4 or exendin-3. The peptide conjugate with the proviso that X is not exendin-3. The peptide conjugate with the proviso that X is not exendin-3. The peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type 1 or type 2 confidences, insulin resistance syndrome, obseity, eating disorder, hyperglycaemia, metabolic disorders and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels clicited by hormones known to increase blood glucose levels clicited by hormones known to increase blood glucose levels clicited by hormones known to increase blood glucose levels clicited by los more alied planes including adrenalin, glucocorricoids, growth hormone and clicited by lease, for l

Exendin agonist, SEQ ID NO:187.

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and insulin secretion increase. GDM pregnancies are with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated with an increased risk of neonatal unbedefects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, pulycythaemia, hypomagnesaemia, pulychaemia, hypomagnesaemia, pulychaemia, hypomagnesaemia, pulycythaemia, hypomagnesaemia, pulycythaemia, hypomagnesaemia, pulychaemia, hypomagnesaemia, pulychaemia, hypomagnesaemia, pulycythaemia, hypomagnesaemia, pulycythaemia, hypomagnesaemia, pulychaemia, hypomymagnesa
Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB64366 Length: 30 February 4, 2005 13:32 Type: P Check: 4862 ound using 'seq5' (mohamed337.key)

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocapanesaemia, polycytheamia, hypocapanesaemia, plycytheamia, hypocapanesaemia, plycomapanesaemia, plyc
                                       Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,

Exerciting the invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both cincrease insulin secretion. In contrast, in a normal pregnancy, both cincrease insulin secretion. In contrast, in a normal pregnancy, both consulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive consorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of meonatal morbidites such as hypoglycaemia, hypomagnessemia, polycythaemia, homology with several members of the glucagon-like peptide family, cardinary secretions of the Gila monster compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                             Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 179; Page 119; 133pp; English.

```
Exendin agonist (AAB64185-B64368) for treating gestational diabetes
mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a
mellitus (GDM) in a patient. GDM arises during pregnancy, both
combination of increased insulin secretion increase. GDM pregnancies are
insulin resistance and insulin secretion increase. GDM pregnancies are
associated with complications in both the mother and the foetus. Women
with GDM have increased rates of Caesarian delivery, hypertensive
disorders such as pre-eclampsia, and urinary tract infections. GDM
results in an elevated rate of foetal abnormalities such as neural tube
compounds as pre-eclampsia, and urinary tract infections. GDM
results in an elevated rate of foetal abnormalities such as neural tube
defects, and is associated with an increased risk of neonatal morbidites
compounds and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Gila monster
compounds used to knexican beaded lizard (exendin-3) which exhibit
compounds used to treat type 2 diabetes, which are contraindicated for
GDM, exendins and exendin agonists do not cross the placenta and thus do
not cause severe prolonged hypoglycemia in the newborn. They have a
compounds used to treat type 2 diabetes, and, unlike conventional
insulin therapy, should not cause weight gain, as they inhibit gastric
emptying and reduce apperite. The present sequence of exendin-4
compounds to the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                  Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                           Example 177; Page 118; 133pp; English.

Exendin agonist, SEQ ID NO:183. 27-MAR-2001 (first entry) AAB64363;

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.

Heloderma suspectum. Synthetic.

The intention feature to the use of an exeminal (whost policy of an exemin agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDW pregnancy, both insulin resistance and insulin secretion increase. GDW pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural mube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporalcaemia, hypomagnessemia, polycythaemia, hyporalcaemia, hypomagnessemia, polycythaemia, hyporalcaemia, hypomagnessemia, polycythaemia, hypopalycaemia, nate peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homelogy with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged effect on blood glucase, and, unlike conventional potent and prolonged effect on blood glucae, and, unlike conventional gonist of the invention which is based upon the sequence of exendin-4 exendin-4 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, invention relates to the use of an exendin (AAB64181-B64182) or an Example 178; Page 119; 133pp; English. especially in a human. Sequence 37 AA;

Exernation relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin receistance and a diminished ability to increase insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive associated with as pre-eclampsia, and urinary tract infections. GDM. Treatlist as a hypoglycaemia, hypomagnessemia, polycythaemia, cauch as hypoglycaemia, hypomagnessemia, polycythaemia, hyporabilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are poptides from the salivary secretions of the Gila monster compounds used to treat type 2 diabetes, which are contraindicated for particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contraind therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The passed upon the sequence of exendin-4 cause weight gain, as they inhibit gastric emptying and reduce appetite. The passed upon the sequence of exendin-4 cause weight gain, as they subiline to a second or a potent and prolonged effect on blood glucose, and, unlike conventional cange weight gain, as they inhibit gastric emptying and reduce appetite. The passed upon the sequence of exendin-4 and a prolonged passed to be a potent or a potent and prolonged effect on blood glucose, and, unlike conventio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 175; Page 117; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistence and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancy, both with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-clampsia, and urinary tract infections. GDM results in an elevated rate of feetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycychaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Beradina are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GiP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4 exendins or exendin agonists for lowering or reducing blood levels and treating gestational diabetes mellitus in a subject, Example 171; Page 115; 133pp; English. especially in a human. Sequence 32 AA; ğ

GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin resistance and insulin secretion increase. GDM pregnancy, both associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal unbeing such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporallirubinaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypodlycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional complying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, Example 172; Page 116; 133pp; English. especially in a human. ```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to insulin resistance and a diminished ability to insulin resistance and a diminished ability to insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, bernology with several members of the glucagon-like peptide family.

Exendins are peptides from the salivary secretions of the dila monster (exendin-3) which several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulintropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cause severe prolonged bypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional menulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin egonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human. CCCCCXSSLTTTTXSXRXRXPXDXPXSSSXRXPXDX

Example 165; Page 112; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both

Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Maxican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional linsulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4 Sequence 28 AA;

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 154; Page 107; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes exendin agonist (AAB64185-B64368) for treating pregnancy, and is due to a mallitus (GDW) in a patient. GDW arises during pregnancy, both increase insulin secretion increase. GDW pregnancy, both increase insulin secretion increase. GDW pregnancis are associated with complications in both the mother and the foetus. Women with GDW have increased rates of Caesarian delivery, hypertensive centiles in an elevated rate of foetal abnormalities such as neural tube disorders such as spec-eclampsia, and urinary infections. GDW perpulirublinemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyporagnesemia, polycythaemia, hypomagnesemia, polycythaemia, cententual amonster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit content and prolonged hypoglycaemia in the newborn. They have a not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional empay, should not cause weight gain, as they inhibit gastric mention which is based upon the sequence repredinger.

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 155; Page 107; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes condinated increase dinsulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both increase insulin secretion. In contrast, in a normal pregnancy, both increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Casaarian delivery, hypertensive with GDM have increased rates of foetal abnormalities such as neural tube results in an elevated with an increased risk of neonatal tube defects, and is associated with an increased risk of neonatal morbidites cuch as hypoglycaemia, hypocadicaemia, hypomagnessemia, polycythaemia, cuch as hypoglycaemia, nypomagnessemia, polycythaemia, cuch as hypoglycaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Glia monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit particularly GLP-1, and have similar insulinotropic effects. Unlike the particularly GLP-1, and have similar insulinotropic effects. Unlike conventional compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which and proper proper proper proper proper proper prop

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both increase insulin secretion increase. GDW pregnancies are associated with complications in both the mother and the foetus. Women with GDW have increased rates of Caesarian delivery, hypertensive associated with complications in both the mother and the foetus. Women with GDW have increased rate of foetal abnormalities such as neural tube caesociated with an increased risk of neonatal morbidites such as spreadylvaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyporagnesemia, polycythaemia, hyporagnesemia, polycythaemia, hypomagnesemia, polycythaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hypomagnesemia, polycythaemia, hypomagnesemia, polycythaemia, hypomagnesemia, polychaemia, polychaemia, polychaemia, hypomagnesemia, polychaemia, poly

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating grestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to insulin resistance and insulin secretion increase. GDM pregnancies are associated with compilcations in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypolycaemia, hypocapusesemia, polycral caemia, hypocapusesemia, polycral caemia, hypocapusesemia, polycral caemia, hypocapusesemia, polycral caemia, hyporapusesemia, polycral cause several members of the present and pacent and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional cause severe prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 150; Page 105; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes concardin agonist (AAB64185-B64368) for treating pregnancy, and is due to a mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a confination of increased insulin secretion increase. GDM pregnancis are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rate of foetal abnormalities such as neural tube celsults in an elevated rate of foetal abnormalities such as neural tube celets, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, celson the salivary secretions of the Gila monster exendin sure peptides from the salivary secretions of the Gila monster (exendin 4) and the Mexican beaded lisard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for one cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin gaonist of the present sequence represents

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 151; Page 105; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes concernain agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to combination of increased insulin secretion in contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase down pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rates of foetal abnormalities such as neural tube creatliss in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocaalcaemia, polycythaemia, configuration are peptides from the salivary secretions of the Gila monster exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit configuration and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contraind the appoint and prolonged effect on blood glucose, and, unlike conventional feature and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 149; Page 104; 133pp; English.

combination relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion increase. GDM pregnancy, both insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancy, both a special with compilcations in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocralcaemia, hypomagnesemia, polycythaemia, hyporalcamia, hypomagnesemia, polycythaemia, hyporalcamia, hypomagnesemia, polycythaemia, byperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the G1a monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cause severe prolonged hypodlycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (CDW) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM creatists in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal worbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporagnesaemia, polycythaemia, on the subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lisard (exendin-3) which exhibit conjogy with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional content and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence represents a exendin

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4. Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, Example 147; Page 103; 133pp; English. Exendin agonist, SEQ ID NO:152. 23-MAY-2000; 2000WO-US014231. 99US-00323867. 27-MAR-2001 (first entry) (AMYL-) AMYLIN PHARM INC. Hiles R, Prickett KS; especially in a human. WPI; 2001-137634/14. Heloderma suspectum WO200073331-A2. 01-JUN-1999; 07-DEC-2000 Synthetic.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candinagonist (BDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both increase insulin secretion. In contrast, in a normal pregnancy, both increased with complications in both the mother and the foetus. Women with GDM have increased rates of Cassarian delivery, hypertensive disorders such as pre-eclampsia, and uninary tract infections. GDM casults in an elevated with an increased risk of neonatal morbidites configuration in the proposal caemia, hypomagnessemia, polycythaemia, such as hypoglycaemia, hypomagnessemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Maxican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for cause severe prolonged fifter on blood glucose, and, unlike conventional contrained and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence of exendin-4, and public based upon the sequence of exendin-4.

remeintain agonist (AABS4185-Beause of an exemunia pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both cincrease insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDW pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Cesanian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDW results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyperallirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDW, exendins and exendin agonists do not cross the placenta and thus do not the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-3 agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention relates to the use of an exendin (AAB64181-B64182) or an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2005 13:32 Type: P Check: 459

Exendin agonist, SEQ ID NO:150.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin resistance and insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the feetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of feetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaenia, hypomagnessemia, polycythaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, bypomagnessemia, polycythaemia, candins are peptides from the salivary secretions of the Gila monster (exendin-3) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type of diabetes, which are contraindicated for compounds used to treat type of any order the propertion of the contraindicated for the contraints and the sevendin and example of contraints and the sevendin and example of compounds used to treat type of any order the contraints and the sevendin and example of the contraints and the sevendin and example of the contraints and the sevendin and example of the contraints and the contraints and the contraints and the contraints and t GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4 Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4. Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, Example 145; Page 102; 133pp; English. 23-MAY-2000; 2000WO-US014231. 99US-00323867. Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, 23-MAY-2000; 2000WO-US014231. (AMYL-) AMYLIN PHARM INC. Hiles R, Prickett KS; especially in a human. WPI; 2001-137634/14. Heloderma suspectum WO200073331-A2. 01-JUN-1999; 07-DEC-2000 Synthetic.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating geteational diabetes cardin agonist (AAB64185-B64368) for treating geteational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and adminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both increase increased rates of Gesarian delivery, hypertensive with GDM have increased rates of Gesarian delivery, hypertensive with GDM have increased rates of Gesarian delivery, hypertensive casuciated with an increased risk of neonatal tube defects, and is associated with an increased risk of neonatal uborders in an elevated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, candin sar peptides from the salivary secretions of the Glia monster (exendin-4) and the Mexican beaded lizard (exendin-3) which each of the grant (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contraind not cause severe prolonged figures, and, unlike conventional capture and prolonged effect on blood glucose, and, unlike conventional capture and prolonged effect on blood glucose, and, unlike conventional capture and prolonged effect. The present sequence of exendin-4 agonist of the invention which is based upon the sequence of exendin-Example 143; Page 101; 133pp; English.

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises duiring pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyporaglocalcaemia, hypomagnesemia, polycythaemia, hyporaglocalcaemia, hypomagnesemia, polycythaemia, hyperbilirubinaemia, and the Mexican beaded lizard (exendin-3) which exhibit components used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used effect on blood glucose, and, unlike conventional potent and prolonged effect on blood glucose, and, unlike conventional computing and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence of exendin-4 exendin-4 exendin-4 exendin-4 based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                  Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 140; Page 100; 133pp; English.

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4. Exendin agonist, SEQ ID NO:146.

Heloderma suspectum Synthetic.

The invention relates to the use of an exentain (AAB641815.504 and the invention relates to the unvention relates to the unvention relates to the unvention relates to the unvention of increased insulin resistance and a diminished ability to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both cinculin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of meonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, comperbilirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placents and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contraind nether and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence of exendin-4 agonist of the invention which is based upon the sequence of exendin-4 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, invention relates to the use of an exendin (AAB64181-B64182) or an Example 141; Page 100; 133pp; English. especially in a human. Sequence 28 AA;

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candin agonist (AAB64185-B64368) for treating pregnancy, and is due to a mellitus (GDM) in a patient. GDM arises during pregnancy, both combination of increased insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM regulates are associated with an increased risk of neonatal tube defects, and is associated with an increased risk of neonatal worbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyporalcaemia, hypomagnesemia, polycythaemia, hyporalcaemia, hypomagnesemia, polycythaemia, hyporalcaemia, hypomagnesemia, polycythaemia, hyporalcaemia, hypomagnesemia, polycythaemia, homology with several members of the glucagon-like peptide family. Caesandin-4) and the Maxican beaded lizard (exendin-4) and the Maxican beaded lizard (exendin-3) which several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-3 emptying and reduce appetite. The present sequence of exendin-3 emptying and reduce appetite. The present sequence of exendin-3

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDW) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancis are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM regulates in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal worbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporalcalcaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycocalcaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, compounds are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDW, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence of exendin-4 emptine and exendin high based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                   exendins or exendin agonists for lowering or reducing blood glevels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 139; Page 99; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64366) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin increase. GDM pregnancies are associated with complications in both the mother and the focus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of focal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-
                                                                                                                                                                                                                         exendins or exendin agonists for lowering or reducing blood levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mallitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion increase and diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both combination of increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive catsociates such as pre-colampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporabilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which satisfy the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulain therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                      Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                              Example 137; Page 98; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes combination of increase insulin parient. GDM arises during pregnancy, both increase insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive alsociated with an increased risk of neonatal women results in an elevated rate of feetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hypocalcaemia, hypomagnesemia, polycythaemia, polycomia, see potention and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exemin. Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, Example 134; Page 97; 133pp; English. especially in a human.

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 135; Page 97; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes method agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to insulin resistance and insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaenia, hypocalcaemia, hypomagnesemia, polycythaemia, hyporalirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit particularly GLP-1, and have similar insulintorropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged bypodlycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional interapy, should not cause weight gain as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4

mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both increases insulin secretion. In contrast, in a normal pregnancy, both cinsulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM crenits in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites cuch as hypoglacemia, hypocalcaemia, hypomagnesemia, polycythaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyposalcaemia, hypomagnesemia, polycythaemia, hyporalinamia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster compounds used to treat type 2 diabetes, which are contrainficated for compounds used to treat type 2 diabetes, which are contrainficated for GDM, exendins and exendin agoniats do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contraint therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The paseent sequence of exendin-4 agonist of the invention which is based upon the sequence of exendin-4 %\$GGGGGGGGGGGGGGGGGGGGG

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 131; Page 95; 133pp; English.

CC The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64168) for treating gestational diabetes combination of increase insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. Obby pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and unimary tract infections. GDM cresults in an elevated rate of foetal abnormalities such as neural tube caesurist in an elevated rate of foetal abnormalities such as neural tube celedist, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocaclaemia, hypomagnessemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are poptides from the salivary secretions of the Gila monster compounds used to treat type 2 diabetes, which are contraindicated for particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for CDM, exendins and exendin agonists do not cross the placent and prolonged effect on blood glucose, and, unlike conventional cinsulin therapy, should not cause weight gain, as they inhibit assendin-query mounts to the invention which is based upon the sequence of exendin-query agonist of the sequence of exendin-query agonist of the sequence of exendin-query agonist of the sequence of exendin-query compounds used upon the sequence of exendin-query compounds to base and the manual prolonged effect on blood glucose.

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of feetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypogalycaemia, hypomagnesaemia, polycythaemia, hypomagnesaemia, polycythaemia, hypomagnesaemia, polycythaemia, hypomagnesaemia, polycythaemia, hypomagnesaemia, polycythaemia, hypomagnesaemia, polycythaemia, hyporphilarubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-1) and the Mexican beaded lizard (exendin-2) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for CDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional potent and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, Example 129; Page 94; 133pp; English. especially in a human.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to

ដូ ដ

increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDW pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDW results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporalitubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects, Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDW, exendins and exendin agonists do not cross the placents and thus do not cause severe prolonged hypolycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4 \$

The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                        GDM; insulin resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             exendins or exendin agonists for lowering or reducing blood elevels and treating gestational diabetes mellitus in a subject,
                                                                                                                 Exendin agonist; gestational diabetes mellitus; GDM; insulin resistancy pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 110; Page 85; 133pp; English.
                                                                                Exendin agonist, SEQ ID NO:115.
                                                                                                                                                                                                                                                                                                                                                                                                          99US-00323867
                                                                                                                                                                                                                                                                                                                                                                23-MAY-2000; 2000WO-US014231

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 111; Page 85; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64186) for treating gestational diabetes menlitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rates of Caesarian delivery, hypertensive cliscutes and is associated with an increased risk of neonatal morbidites cells in an elevated rate of focal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaenia, hypocapanesaenia, polycythaemia, hypocapanesaenia, polycythaemia, hypocapanesaenia, polycythaemia, hypocapanesaenia, polycythaemia, chypocaplicaenia, polycythaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-2) which exhibit chomology with several members of the glucason-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the computer was and exercise of proposition and exercise of proposition and exercise of particularly dispersion and proposition are peptides. Which are obtained and exercise of particularly dispersion and exercise of particularly dispersional exercises. Which are contrained and thus do GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and adminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites usuch as hypoglycaemia, hypomagnessamia, polycythaemia, hyporalicania, hypomagnessamia, polycythaemia, hyporalicania, condises to the glucason of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not coase severe prolonged hypoglycaemia in the newborn. They have a contraind of a coase severe prolonged hypoglycaemia in the newborn.
                                              Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendit agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 108; Page 84; 133pp; English.

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 109, Page 84; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites cuch as hypoglycaenia, hypocaphaseasemia, polychaenia, hypocaphistophiansemia, and subsequent childhood and adolescent obseity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the common and exending and contraind care of contraindicated for compounds used to treat type 2 diabetes which are contraindicated for compounds used. GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

combination features to the use of an exeminal (whost set in teatures) of an exeminal disbetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of meonatal morbidites such as hypoglycaemia, hypochagnesemia, phypomagnesemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Glum monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agoniets do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional contraint respective and prolonged effect on blood glucose, and, unlike conventional consults and reduce appetite. The present sequence represents a exendin exendin agonist of the present sequence of exendin-4 agonist of the invention which is based upon the sequence of exendin-4
cx The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mallitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive also may be a secciated with an increased risk of neonatal tube caesults in an elevated rate of focal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypodycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, polycythaemia, hypomagnesaemia, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exendins or exendin agonists for lowering or reducing blood elevels and treating gestational diabetes mellitus in a subject,

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the focus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rates of Caesarian delivery, hypertensive consults in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythraemia, byperthilmulamenia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-3) which several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contrainding med effect on blood glucose, and, unlike conventional contrainding med effect on blood glucose, and, unlike conventional emperator and prolonged effect on blood glucose, and, unlike conventional contrainding med effect on blood glucose, and, unlike conventional contrainding med effect on blood glucose, and, unlike grantic emprying and reduce appetite. The present sequence represents a exendin emperator in blood glucose, and, unlike different end prolonged effect on blood glucose, and, unlike emperato
                                                                                                                                                                                                                                                                                                         exendins or exendin agonists for lowering or reducing blood e levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 102; Page 81; 133pp; English.

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 103; Page 81; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an examdin agonist (AAB64185-B64368) for treating gestational diabetes candin agonist (AAB64185-B64368) for treating gestational diabetes cardin agonist (AAB64185-B64368) for treating greguancy, and is due to a combination of increased insulin resistance and diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Casaarian delivery, hypertensive with GDM have increased rate of foetal abnormalities such as neural tube compared in a seociated with an increased risk of neonatal tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnasemia, polycythaemia, comparation and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Glia monster (exendin-4) and the Maxican beaded lizard (exendin-3) with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists of not cross the placenta and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional contraint therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 emphasition which is based upon the sequence of exendin-4

In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the sallivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin suponists of the present and prolonged effect on blood glucose, and, unlike conventional potent and prolonged effect on blood glucose, and, unlike conventional emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                      Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention relates to the use of an exendin (AAB64181-B64182) or an

Exerciting source to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion. In contrast, in a normal pregnancy, both insulin resistence and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive associated with an increased risk of neonatal morbidities results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidities such as hypoglycaemia, hypocmagnessaemia, polycythaemia, hyporallirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Glia monster (exendin-4) and the Maxican beaded lizard (exendin-3) which servibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinorropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cross the placent and prolonged effect on blood glucose, and, unlike conventional insuluin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-3 agonist of the invention which is based upon the sequence of exendin-4 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, Example 101; Page 80; 133pp; English. 99US-00323867. (AMYL-) AMYLIN PHARM INC. especially in a human. Hiles R, Prickett KS; WPI; 2001-137634/14. Sequence 28 AA; 01-JUN-1999;

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Cesearian delivery, hypertensive consolities in an elevated rate of foetal abhormalities such as neural tube results in an elevated rate of foetal abhormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, contrains are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which serving the compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placents and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contrainding and reduce appetite. The present sequence represents a exendin empaying and reduce appetite. The present sequence of exendin-3 exendin sequence of exendin-3 exendin sequence of exendin-3 exend

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY17568
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are epetides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                   Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Type: P Check: 131
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  to: 28

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

                                                                                                                                                                                                                                                                                AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide agonists of exendin - delay stomach emptying, for treating
                                                                                                                                                        Peptide agonists of exendin - delay stomach emptying, for treating

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperaglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Maxico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAV17565 Length: 28 February 4, 2005 13:32 Type: P Check: 53 Found using 'seq5' (mohamed337.key)

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are epptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or they can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are epptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin, agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                               Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Check: 201

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exending are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
        Exendin, agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                       exendin - delay stomach emptying, for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAV17559 Length: 28 February 4, 2005 13:32 Type: P Check: 260 Found using 'seq5' (mohamed337.key)

Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

AAV17535 to AAV17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels) Claim 28; Fig 4; 144pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                        AAY17515 to AAY17624 represent exendin peptide agonists. AAY17515 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetee mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                   Peptide agonists of exendin - delay stomach emptying, for treating

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be affect or no vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                            Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY17554 Length: 28 February 4, 2005 13:32 Type: P Check: 546 Found using 'seq5' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                             AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                            AAY17515 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                               Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAV17550 Length: 28 February 4, 2005 13:32 Type: P Check: 798 Found using 'seq5' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                            Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY17549 Length: 28 February 4, 2005 13:32 Type: P Check: 156 Found using 'seq5' (mohamed337.key)

The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be affect in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                          to AAY17624 represent exendin peptide agonists. Exendins are

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. ```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are epptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Waxico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                  Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin, agonist, Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY17545 Length: 28 February 4, 2005 13:32 Type: P Check: 242 ound using 'seq5' (mohamed337.key)

Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin, agonist, Heloderma sp, Gila monster, venom, lizard, diabetes mellitus type I, diabetes mellitus type II; hyperglycaemia, hypoglycaemia, plasma glucose, gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

                                                                                                                                                                                                                                                                                                   AAY17543;
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                   Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                           AAY17541 Length: 28 February 4, 2005 13:32 Type: P Check: 676 Found using 'seq5' (mohamed337.key)

```
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard andogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.

                                                                                                                                            AAY17540;
                                                                                                        endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetees mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                                                   Type: P Check: 234
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Type: P Check: 693

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hypergylycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are peptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY17535 to AAY17624 represent exendin peptide agonists. Exendins epptides that are found in the venom of the Gila-monster, a lizard
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide agonists of exendin - delay stomach emptying, for treating diabetes and hypo- or hyper-glycemia.
                                                                                                                                  Peptide agonists of exendin - delay stomach emptying, for treating
                                                                                                                                                                                                                                                                                                                                                                      AAY17537 Length: 28 February 4, 2005 13:32 Type: P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY17538;
AAY17535 to AAY17624 represent exendin peptide agonists. Exendins are epptides that are found in the venom of the Gila-monster, a lizard endogenous to Arizona and Northern Mexico. The peptide agonists are used to treat diabetes mellitus (types I or II), hyperglycaemia or hypoglycaemia. They can also be used for in vitro and in vivo studies on exendins and their agonists. They regulate gastric motility and slow gastric emptying (resulting in lower post-prandial glucose levels)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin; agonist; Heloderma sp; Gila monster; venom; lizard; diabetes mellitus type I; diabetes mellitus type II; hyperglycaemia; hypoglycaemia; plasma glucose; gastric emptying; stomach emptying.

```
The invention relates to exendin agonists which slow gastric emptying and lower plasma glucose levels. The peptides are of the formula Xaal-Xaa2-CC (Xaa3-Gly-Thr.Xaa4-Xaa6-Xaa6-Xaa1-Xaa6-Ser-Lys-Asn-Gly-Glu-- Glu-- G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New exendin agonists - useful in the treatment of Type I and II diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin, agonist, diabetes, disorder, plasma glucose, gastric; diagnostic; gastro-intestinal; radiological; generic.
                                                                                                                                                                                                                                                                                                                                                                                          to: 39
